Road is unendingly created across numerous locations everywhere the country. this system of observation the development method and health is manually and so becomes tedious and physically not possible many another time. Roads so become due for repairs / maintenance untimely due to numerous reasons. there's a demand to plot good sensible wise method like sensible imaging technology through smart devices put in on remote operated / autonomous vehicles for overseeing throughout transportation, etc. there's an on the spot ought to establish a viable answer to extend the longevity of roads and stop premature failure. Due to climatic conditions, improper construction and overloading of vehicles the roads are becoming broken. So, if we have a tendency to create a model which may sight the potholes or damages in any road and may provides a pre warning to the riders it can minimize the possibilities of accidents. The scope of the project lies, wherever the irregularity of the road affects public folks. This can be utilized in four wheeler, particularly for automobile drivers so they might save several lives in time or as a feature for self-driving vehicles.
